

ABSTRACT

[0036] A graphical user interface for browsing information displayed to a user. The information displayed includes zero or more elements and may be displayed in a display window. The display window has a perimeter and a scrollbar is positioned along the perimeter. The scrollbar may have a first end and a second end and a slider located between the ends. The slider may be configured such that movement of the slider causes information in the display area to be scrolled. In one embodiment, the size of the slider is based on the size of the one more elements of information displayed in the display window. A data-line may be positioned adjacent the scrollbar and may have a plurality of tick marks. A graphical element, which may be displayed in phantom, may be used to associate the slider to the data-line.
